Hey Vergil! Your matrix-computing days are over.

> Author: Artanisax

> Keywords: reference & pointer, multi-dimensional operation simulation, shallow/deep copy, ROI

Description

<div align="center">

JUNE 15, 05:14 PM

</div>

Vergil misses his son Neuro and decides to open a portal with Yamato to see him. Now he needs you to implement a matrix library based on `C++` to help calculate the path.

Since Vergil has little modern knowledge, especially math, you only need to support matrices with `int` entries. You are also required to implement both **shallow/deep copy** and rectangular **ROI** (Region of Interest) features because Vergil desperately wants to save memory for pursuing power.

Dante offers some assistance so that the data structures and function declarations have been made and you are only required to complete the function definitions.

Hint

- In this question, you are supposed to use `new/delete` to manage data. Using C-style functions like `malloc/calloc/free` will lead to **Runtime Error** when testing. For this question specifically, you only need to use sentences resemble `mat.data = new Data(row, col);` and `delete mat.data;` to manage `Data` pointers as the jobs inside `Data` have been done by the constructor and destructor.

- You are allowed to implement other functions to help to implement required functions. But we will only invoke the functions we declared during the test process.

- The following picture will roughly illustrate the difference between **shallow copy** and **deep copy**:
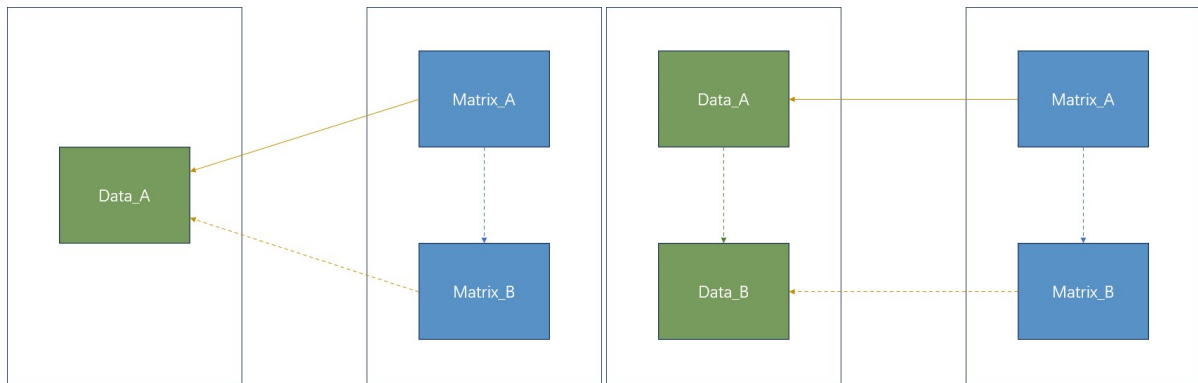

- For **ROI**, you may try to understand `print_matrix()` to obtain some insight.

Test Cases

We guarantee that all the parameters are valid, i.e. all the matrices are matched in dimensions.

There are `10` test cases in total testing the following features of your implementation:

- Case 1-4: Basic matrix arithmetic operations
- Case 5-9: Operations with ROI
- Case 10: Memory management (`shallow_copy()` and `ref_cnt` are only checked in this cas)

Template

```cpp
1   //PREPEND BEGIN
2   #include <iostream>
3   #include <cstdlib>
4   #include <cstring>
5
6   using namespace std;
7
8   struct Data
9   {
10      int *entry;
11      size_t row, col;
12      size_t ref_cnt;
13
14      Data(size_t row, size_t col):
15          row(row), col(col), ref_cnt(0)
16      { entry = new int[row * col]{}; }
17
18      ~Data()
19      { delete[] entry; }
20  };
21
22  struct Matrix
23  {
24      Data *data;        // the ptr pointing to the entries
25      size_t start;      // the starting index of ROI
26      size_t row, col;   // the shape of ROI
27
```

```cpp
    Matrix():
        data(nullptr), start(0), row(0), col(0) {}

    ~Matrix()
    {
        if (!data)
            return;
        if (!--data->ref_cnt)
            delete data;
    }
};

void print_matrix(Matrix &mat)
{
    for (size_t r = 0; r < mat.row; r++)
    {
        size_t head = mat.start+r*mat.data->col;
        for (size_t c = 0; c < mat.col; c++)
            cout << mat.data->entry[head + c] << ' ';
        cout << '\n';
    }
    cout << endl;
}
//PREPEND END

//TEMPLATE BEGIN
void unload_data(Matrix &mat)
{
    // TODO
    // Noted that `mat.data` could be `nullptr` here
}

void load_data(Matrix &mat, Data *data, size_t start, size_t row, size_t col)
{
    // TODO
}

void shallow_copy(Matrix &dest, Matrix &src)
{
    // TODO
}

void deep_copy(Matrix &dest, Matrix &src)
{
    // TODO
}

bool equal_matrix(Matrix &a, Matrix &b)
{
    // TODO
}

void add_matrix(Matrix &dest, Matrix &a, Matrix &b)
{
    // TODO
```

```cpp
83    }
84
85    void minus_matrix(Matrix &dest, Matrix &a, Matrix &b)
86    {
87        // TODO
88    }
89
90    void multiply_matrix(Matrix &dest, Matrix &a, Matrix &b)
91    {
92        // TODO
93    }
94    //TEMPLATE END
95
96    //APPEND BEGIN
97    void test()
98    {
99        // Sample code on how to use your library
100       Data *da = new Data(3, 2), *db = new Data(2, 3);
101       for (size_t i = 0; i < 6; i++)
102           da->entry[i] = db->entry[i] = i;
103
